PROFESSIONAL SUMMARY

Google Workspace and Cloud Solutions Engineer with 10+ years owning GWS environments from the ground up, including tenant architecture, OU design, policy governance, identity integration, and the automation that ties it all together. Career spans Salesforce, Meta, SADA, 66 Degrees, and Brio Technologies, with hands-on experience in SAML/SSO, SCIM, Advanced GAM, Apps Script, and the Workspace Admin SDK. Recently focused on integrating LLM APIs into operational workflows: building AI agents that handle employee lifecycle management, auto-generate proposals, score job postings, and run security audits using Anthropic Claude, Grok, Gemini Enterprise, and Vertex AI. I build things that last and document them so they stay that way.

CORE COMPETENCIES

AI Agents & Automation	Google Workspace & Cloud	Security & Identity
- Vertex AI, Agent Builder, GCP - Anthropic Claude, Grok, Gemini Enterprise - Python, Apps Script, agentic workflows	- Tenant architecture, OU/directory design - Large-scale migrations, CloudM - Shared Drives, Mail routing, FedRAMP	- SSO/SAML/SCIM, Okta, Salesforce Identity - DLP, e-discovery, 2SV, audit readiness - Advanced GAM, PowerShell, Admin SDK

PROFESSIONAL EXPERIENCE

Brio Technologies — GWS Solutions Engineer

April 2025 – Present

- Built a full-lifecycle HR bot for Google Chat, backed by GCP and Google Apps Script. The bot handles onboarding and offboarding, end-to-end provisioning of accounts, managing OU placement, Drive transfers, and audit logging, with access gated by a dedicated Google Group and rich confirmation cards for destructive actions. Reduced repeated Super Admin touchpoints and cut onboarding cycle time by roughly 70%.
- Deployed AI-powered agents using Vertex AI, Anthropic Claude, Grok, Gemini Enterprise, and Google Agent Builder, generating an estimated 40–60 hours per month in time savings across HR, IT, and sales teams.
- Built agentic workflows that auto-formalize Statements of Work and proposals, draft client-facing emails, and produce monthly security audits and daily MFA compliance reports — cutting manual review effort by 15–20 hours weekly.
- Wrote a PowerShell migration setup tool (New-CloudMMigration.ps1) that standardizes GCP project creation and gcloud configuration naming for every new CloudM engagement, eliminating the naming drift and context-switching errors that compound quickly across simultaneous multi-client migrations.
- Managed complex multi-tenant GWS migrations using CloudM and Advanced GAM scripting; maintained a clean project state across simultaneous accounts to reduce errors and lost items in high-volume environments.
- Designed full-stack GWS tenant architecture across SMB clients, OU structure, mail routing, Shared Drives governance, reducing permission-related incidents by 85% and saving clients an estimated 120 hours per month in admin overhead.
- Delivered a complete Okta + Salesforce Identity to GWS SSO/SCIM integration with SAML app config, attribute mapping, JIT provisioning, and automated group sync, moving the client from fully manual provisioning to hands-off lifecycle management and eliminating an estimated \$75K in annual labor costs.

Karcher — Google Workspace Developer

February 2025 – April 2025 • Contract

- Brought in post-cutover to fix what a rushed O365-to-GWS migration left behind: broken mail routing, calendar resources that hadn't been recreated, and Shared Drive permissions that didn't carry over cleanly.
- Rewrote core VBA macros in Google Apps Script with configuration-as-code and health monitoring, reduced execution errors by 95%, and saved 40 hours per week in manual processing. Those macros ran critical business workflows, so getting them right mattered.
- Built and delivered a hands-on admin training series so the internal team could handle routine GWS management without outside help. External support dependency dropped to zero within 60 days.

66 Degrees — Google Workspace Deployment Lead

June 2024 – October 2024 • Contract

- Ran two concurrent migration tracks simultaneously, GWS-to-GWS and GWS-to-M365, covering email, Drive, connected SaaS integrations, and everything from kickoff through hypercare. Zero blown cutover windows.
- Scripted multi-domain tenant configuration in Advanced GAM; kept project state in Jira and runbooks in GitHub, so nothing critical lived only in someone's inbox.
- Coordinated across IT Ops, Security, and third-party vendor contacts on both tracks; delivered postmortems that improved platform reliability by 40%. The configuration-as-code approach reduced deployment time by 60%.

Salesforce — Collaboration Systems Engineer

October 2023 – April 2024 • Contract

- Owned GWS security and compliance posture for a FedRAMP High environment, access controls, audit logging, DLP policies, data protection configs, and DoD IL requirements. Not just general best practices; everything had to hold up under formal audit.
- Built a GAM + Apps Script + Python automation stack deployed via Heroku: user lifecycle processing, license reconciliation, and daily tenant health checks running without manual intervention, saving an estimated \$180K annually in operational costs.
- Configured and validated SPF, DKIM, and DMARC; enforced 2SV policy by OU and department; locked down external sharing and reduced security incidents by 75% while keeping downtime at zero.

Pansophic Learning — Google Workspace SME

February 2023 – October 2023 • Contract

- Inherited a GWS environment carrying years of configuration debt. Rebuilt external sharing rules, DLP policies, and retention settings from scratch, reduced compliance risk by 90%.
- Automated repetitive admin work in PowerShell and Python: group management, user audits, license reporting. Cut real hours out of the team's weekly ops load, roughly 25 hours per week.
- Ran separate training sessions for admins and end users; very different audiences, very different sessions. Support ticket volume dropped by 65%.

Meta (Facebook) — Senior Google Workspace Engineer — SME

June 2022 – February 2023 • Contract

- GWS engineering inside one of the largest Workspace deployments in the world. That scale changes how you think about almost everything; a config change that's trivial at 500 users has real consequences at hundreds of thousands.
- Executed tenant config changes, led UAT, and performed workflow analysis; caught several production-bound issues before they shipped.
- Designed and delivered training programs for both technical staff and general employees — adoption-focused content, not feature walkthroughs.

Kincaid IT — Google Workspace Deployment Engineer

November 2020 – June 2022 • Full-Time

- Led enterprise GWS deployments across multiple clients, each involving thousands of users. Covered domain setup, OU architecture, third-party app integrations, and everything needed to hand off a clean, documented environment.
- Built infrastructure assessment frameworks and admin automation scripts; wrote post-go-live documentation that people actually referenced instead of ignoring.

SADA — Google Cloud Consultant II

October 2018 – August 2020 • Full-Time

- GWS administration for enterprise clients, Advanced GAM automation for user and group management at scale, executive IT support with near-zero tolerance for downtime, and MDM/endpoint compliance work alongside the security team.
- Built and maintained audit readiness documentation across multiple client environments; developed automation scripts that reduced manual admin load significantly in high-volume accounts.

Finchloom — Cloud Administrator — M365

April 2017 – January 2018 • Full-Time

- Managed Microsoft 365, Azure AD, Intune, and Okta environments, SSO/MFA configuration, Exchange administration, O365 migrations, and compliance/security governance.

AI AGENTS & INDEPENDENT PROJECTS

Built independently to explore AI-assisted development across platforms and use cases:

- GWS HR Lifecycle Bot — Google Chat bot backed by GCP + Apps Script for full onboarding/offboarding, with Google Group-gated access control and confirmation cards for destructive operations.
- Job Scout AI (Open Source) — Apps Script job scraper that scores listings against a custom rubric using Groq Llama 3.3 70B and delivers a ranked HTML digest by email daily.
- People Research Agent — Python tool that chains Google Custom Search with Gemini to generate executive-style dossiers, with batch processing and aggressive rate-limit retry logic.
- Proposal Generation Agent — Python script that assembles structured SOW/proposal documents from parameterized inputs and renders formatted output programmatically.
- Mac Cleanup Agent — Python macOS utility with dry-run safety mode, disk/process reporting, large-file finder, node_modules detection, and targeted cache cleanup across browsers and dev toolchains.
- CloudM Migration Setup Tool — PowerShell wrapper that enforces consistent GCP project naming and gcloud configuration setup at the start of every new CloudM engagement.
- AI platforms used: Anthropic Claude, Grok, Gemini (Standard + Enterprise), Vertex AI, Google Agent Builder, and Google Apps Script.
